

SAR TEST REPORT (15.407)

REPORT NO.: SA980313L04-1

MODEL NO.: MC9596

RECEIVED: Mar. 13, 2009

TESTED: Mar. 24 ~ Mar. 26, 2009

ISSUED: Apr. 02, 2009

APPLICANT: Motorola, Inc.

ADDRESS: One Motorola Plaza, Holtsville, NY 11742-1300

USA

ISSUED BY: Bureau Veritas Consumer Products Services

(H.K.) Ltd., Taoyuan Branch

LAB ADDRESS: No. 47, 14th Ling, Chia Pau Tsuen, Lin Kou

Hsiang, Taipei Hsien 244, Taiwan, R.O.C.

TEST LOCATION: No. 19, Hwa Ya 2nd Rd, Wen Hwa Tsuen, Kwei

Shan Hsiang, Taoyuan Hsien 333, Taiwan, R.O.C.

This test report consists of 40 pages in total except Appendix. It may be duplicated completely for legal use with the approval of the applicant. It should not be reproduced except in full, without the written approval of our laboratory. The client should not use it to claim product endorsement by TAF or any government agencies. The test results in the report only apply to the tested sample.

Report No.: SA980313L04-1 1 Report Format Version 3.0.0

1. CERTIFICATION

PRODUCT: Mobile Computer

MODEL: MC9596 BRAND: Motorola

APPLICANT: Motorola, Inc.

TESTED: Mar. 24 ~ Mar. 26, 2009

TEST SAMPLE: ENGINEERING SAMPLE

STANDARDS: FCC Part 2 (Section 2.1093)

FCC OET Bulletin 65, Supplement C (01-01)

RSS-102

The above equipment (model: MC9596) has been tested by **Bureau Veritas Consumer Products Services (H.K.) Ltd., Taoyuan Branch**, and found compliance with the requirement of the above standards. The test record, data evaluation & Equipment Under Test (EUT) configurations represented herein are true and accurate accounts of the measurements of the sample's EMC characteristics under the conditions specified in this report.

PREPARED BY : Apr. 02, 2009

Andrea Hsia / Specialist

TECHNICAL

ACCEPTANCE: James Jan., DATE: Apr. 02, 2009

Responsible for RF James Fan / Engineer

APPROVED BY: Gay Gay, DATE: Apr. 02, 2009

Gary Chang / Assistant Manager

2. GENERAL INFORMATION

2.1 GENERAL DESCRIPTION OF EUT

EUT	Mobile Computer							
MODEL NO.	MC9596	MC9596						
FCC ID	UZ7MC9596							
POWER SUPPLY	3.7Vdc from rechargeable lithiur12Vdc from power adapter	m battery						
MODULATION TYPE	CCK, DQPSK, DBPSK for DSS 64QAM, 16QAM, QPSK, BPSK							
MODULATION TECHNOLOGY	DSSS, OFDM							
TRANSFER RATE	54.0/ 48.0/ 36.0/ 24.0/ 18.0/ 12.0	0/ 9.0/ 6.0Mbps						
OPERATING FREQUENCY	5180 ~ 5320MHz & 5500 ~ 5700	DMHz						
NUMBER OF CHANNEL	5180 ~ 5320MHz: 8 5500 ~ 5700MHz: 11							
CHANNEL FREQUENCIES UNDER TEST AND ITS CONDUCTED OUTPUT POWER	Main antenna 10.280mW / Ch36: 5180MHz 9.354mW / Ch40: 5200MHz 8.570mW / Ch44: 5220MHz 7.962mW / Ch48: 5240MHz 7.656mW / Ch52: 5260MHz 6.998mW / Ch56: 5280MHz 7.780mW / Ch60: 5300MHz 7.178mW / Ch60: 5300MHz 11.246mW / Ch100: 5500MHz 21.038mW / Ch104: 5520MHz 24.044mW / Ch108: 5540MHz 22.856mW / Ch112: 5560MHz 28.249mW / Ch116: 5580MHz 29.040mW / Ch120: 5600MHz 28.314mW / Ch120: 5600MHz 26.363mW / Ch128: 5640MHz 24.717mW / Ch136: 5680MHz 21.979mW / Ch136: 5680MHz 6.823mW / Ch140: 5700MHz	Aux. antenna 11.272mW / Ch36: 5180MHz 9.638mW / Ch40: 5200MHz 8.831mW / Ch44: 5220MHz 9.141mW / Ch48: 5240MHz 10.046mW / Ch52: 5260MHz 10.304mW / Ch56: 5280MHz 11.376mW / Ch60: 5300MHz 10.280mW / Ch60: 5300MHz 11.588mW / Ch100: 5500MHz 23.227mW / Ch104: 5520MHz 24.210mW / Ch108: 5540MHz 23.067mW / Ch112: 5560MHz 29.580mW / Ch112: 5560MHz 30.832mW / Ch116: 5580MHz 29.040mW / Ch120: 5600MHz 29.040mW / Ch124: 5620MHz 24.889mW / Ch136: 5640MHz 25.235mW / Ch136: 5680MHz 7.129mW / Ch140: 5700MHz

3. The EUT has one lithium battery listed as below:

LI-ION BATTERY								
BRAND: MOTOROLA								
MODEL:	82-111636-01							
RATING:	3.7Vdc, 4800mAh, 17.7Wh							

4. The EUT is a Mobile Computer. The functions of EUT listed as below:

	REFERENCE REPORT
WLAN 802.11b/g	SA980313L04
WLAN 802.11a (5745~5825 MHz)	3A900313L04
WLAN 802.11a	SA980313L04-1
(5180 ~ 5320MHz, 5500 ~ 5700MHz)	3A900313L04-1
BLUETOOTH	SA980313L04-2
GSM 850 / WCDMA 850	SA980313L04-3
PCS 1900 / WCDMA 1900	3A900313L04-3

5. The following accessories are for support units only.

PRODUCT	BRAND	MODEL	DESCRIPTION
USB charging Y cable	Motorola	-	1.8m shielded cable with one core
Headset	Motorola	-	0.8m non-shielded cable with one core
Adapter	HIPRO	HP-O2040D43	Input: 100-240Vac, 50-60Hz, 1.5A Output: 12Vdc, 3.33A, MAX 40W Power line: AC 1.7m non-shielded cable without core DC1.8m non-shielded cable with one core

- 6. The EUT operates in both the 5GHz and 2.4GHz Bands and compatibility with 802.11a and 802.11b, 802.11g technology.
- 7. The EUT operates in the 2.4GHz/5GHz frequency spectrum with throughput of up to 54Mbps.
- 8. The above EUT information was declared by manufacturer and for more detailed features description, please refer to the manufacturer's specifications or User's Manual.

2.2 GENERAL DESCRIPTION OF APPLIED STANDARDS

According to the specifications of the manufacturer, this product must comply with the requirements of the following standards:

FCC Part 2 (2.1093)
FCC OET Bulletin 65, Supplement C (01- 01)
RSS-102
IEEE 1528-2003

All test items have been performed and recorded as per the above standards.

2.3 GENERAL INOFRMATION OF THE SAR SYSTEM

DASY5 (software 5.0 Build 125) consists of high precision robot, probe alignment sensor, phantom, robot controller, controlled measurement server and near-field probe. The robot includes six axes that can move to the precision position of the DASY5 software defined. The DASY5 software can define the area that is detected by the probe. The robot is connected to controlled box. Controlled measurement server is connected to the controlled robot box. The DAE includes amplifier, signal multiplexing, AD converter, offset measurement and surface detection. It is connected to the Electro-optical coupler (ECO). The ECO performs the conversion form the optical into digital electric signal of the DAE and transfers data to the PC.

EX3DV3 ISOTROPIC E-FIELD PROBE (FREQUENCY BAND 5 ~ 6GHz)

DIMENSIONS Overall length: 330 mm (Tip Length: 20 mm)

Tip diameter: 2.5 mm (Body diameter: 12 mm)
Distance from probe tip to dipole centers: 1.0 mm

APPLICATION General dosimetric measurements range 5 ~ 6 GHz.

Fast automatic scanning in arbitrary phantoms (EX3DV3)

NOTE

- 1. The Probe parameters have been calibrated by the SPEAG. Please reference "APPENDIX D" for the Calibration Certification Report.
- 2. For frequencies above 800 MHz, calibration in a rectangular wave-guide is used, because wave-guide size is manageable.
- 3. For frequencies below 800 MHz, temperature transfer calibration is used because the wave-guide size becomes relatively large.

TWIN SAM V4.0

CONSTRUCTION The shell corresponds to the specifications of the Specific

Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528-2003, EN 62209-1 and IEC 62209. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by manually

teaching three points with the robot.

SHELL THICKNESS 2 ± 0.2mm

FILLING VOLUME Approx. 25liters

DIMENSIONS Height: 810mm; Length: 1000mm; Width: 500mm

SYSTEM VALIDATION KITS:

CONSTRUCTION Symmetrical dipole with I/4 balun enables measurement of

feedpoint impedance with NWA matched for use near flat

phantoms filled with brain simulating solutions. Includes distance holder and tripod adaptor

CALIBRATION Calibrated SAR value for specified position and input power at

the flat phantom in brain simulating solutions

FREQUENCY 5200MHz, 5500MHz

RETURN LOSS > 20dB at specified validation position

POWER CAPABILITY > 100W (f < 1GHz); > 40W (f > 1GHz)

OPTIONS Dipoles for other frequencies or solutions and other calibration

conditions upon request

DEVICE HOLDER FOR SAM TWIN PHANTOM

CONSTRUCTION

The device holder for the mobile phone device is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear reference points). The rotation centers for both scales is the ear reference point (ERP). Thus the device needs no repositioning when changing the angles. The holder has been made out of low-loss POM material having the following dielectric parameters: relative permittivity ε =3 and loss tangent δ =0.02. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered. The device holder for the portable device makes up of the polyethylene foam. The dielectric parameters of material close to the dielectric parameters of the air.

DATA ACQUISITION ELECTRONICS

CONSTRUCTION

The data acquisition electronics (DAE3) consists of a highly sensitive electrometer grade preamplifier with auto-zeroing, a channel and gain-switching multiplex, a fast 16 bit AD converter and a command decoder and control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information as well as an optical uplink for commands and the clock. The mechanical probe is mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection. The input impedance of the DAE3 box is 200MOhm; the inputs are symmetrical and floating. Common mode rejection is above 80 dB.

Report No.: SA980313L04-1 9 Report Format Version 3.0.0

2.4 GENERAL DESCRIPTION OF THE SPATIAL PEAK SAR EVALUATION

The DASY5 post-processing software (SEMCAD) automatically executes the following procedures to calculate the field units from the micro-volt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

Probe parameters: - Sensitivity Norm_i, a_{i0}, a_{i1}, a_{i2}

- Conversion factor ConvF_i

- Diode compression point dcpi

Device parameters: - Frequency F

- Crest factor Cf

Media parameters: - Conductivity σ

- Density ρ

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$V_i = U_i + U_i^2 \bullet \frac{cf}{dcp_i}$$

 V_i =compensated signal of channel i (i = x, y, z) U_i =input signal of channel I (i = x, y, z)

Cf =crest factor of exciting field (DASY parameter)
dcp_i =diode compression point (DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated:

E-fieldprobes:
$$E_i = \sqrt{\frac{V_1}{Norm_i \cdot ConvF}}$$

H-fieldprobes:
$$H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}$$

 V_i =compensated signal of channel I (i = x, y, z)

Norm_i = sensor sensitivity of channel i $\mu V/(V/m)2$ for (i = x, y, z)

E-field Probes

ConvF = sensitivity enhancement in solution

a_{ii} = sensor sensitivity factors for H-field probes

F = carrier frequency [GHz]

E_i = electric field strength of channel i in V/m H_i = magnetic field strength of channel i in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1'000}$$

SAR = local specific absorption rate in mW/g

E_{tot} = total field strength in V/m

 σ = conductivity in [mho/m] or [Siemens/m]

 ρ = equivalent tissue density in g/cm3

Note that the density is set to 1, to account for actual head tissue density rather than the density of the tissue simulating liquid. The entire evaluation of the spatial peak values is performed within the Post-processing engine (SEMCAD). The system always gives the maximum values for the 1g and 10g cubes. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- 1. The extraction of the measured data (grid and values) from the Zoom Scan
- 2. The calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- 3. The generation of a high-resolution mesh within the measured volume
- 4. The interpolation of all measured values from the measurement grid to the high-resolution grid
- 5. The extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- 6. The calculation of the averaged SAR within masses of 1g and 10g.

The probe is calibrated at the center of the dipole sensors that is located 1 to 2.7mm away from the probe tip. During measurements, the probe stops shortly above the phantom surface, depending on the probe and the surface detecting system. Both distances are included as parameters in the probe configuration file. The software always knows exactly how far away the measured point is from the surface. As the probe cannot directly measure at the surface, the values between the deepest measured point and the surface must be extrapolated. The angle between the probe axis and the surface normal line is less than 30 degree.

The maximum search is automatically performed after each area scan measurement. It is based on splines in two or three dimensions. The procedure can find the maximum for most SAR distributions even with relatively large grid spacing. After the area scanning measurement, the probe is automatically moved to a position at the interpolated maximum. The following scan can directly use this position for reference, e.g., for a finer resolution grid or the cube evaluations. The 1g and 10g peak evaluations are only available for the predefined cube 7 x 7 x 7 scans. The routines are verified and optimized for the grid dimensions used in these cube measurements. The measured volume of 30 x 30 x 30mm contains about 30g of tissue. The first procedure is an extrapolation (incl. boundary correction) to get the points between the lowest measured plane and the surface. The next step uses 3D interpolation to get all points within the measured volume in a 1mm grid (42875 points). In the last step, a 1g cube is placed numerically into the volume and its averaged SAR is calculated. This cube is the moved around until the highest averaged SAR is found. If the highest SAR is found at the edge of the measured volume, the system will issue a warning: higher SAR values might be found outside of the measured volume. In that case the cube measurement can be repeated, using the new interpolated maximum as the center

3. DESCRIPTION OF SUPPORT UNITS

The EUT has been tested as an independent unit.

4. DESCRIPTION OF TEST MODES AND CONFIGURATIONS

4.1. DESCRIPTION OF TEST MODE

Test tool is CEcTXRX provided by client. It can control EUT to transmit continuously at specific channel, output power level, data rates and 100 % duty signal.

"Per KDB 248277, for each frequency band, testing at higher data rates and higher order modulations is not required when the maximum average output power for each of these configurations is less than 1/4 dB higher than those measured at the lowest data rate."

Comparing output power of all modulations and data rates of each mode can find the lowest data rates has max output power. Therefore, EUT will set under lowest data rates to test.

"Per KDB 447498, when the SAR procedures require multiple channels to be tested and the 1-g SAR for the highest output channel is less than 0.8 W/kg and peak SAR is less than 1.6w/kg, where the transmission band corresponding to all channels is ≤ 100 MHz, testing for the other channels is not required."

According to test data from table of section 4.2, SAR value of highest output power channel of 5180~5240 and 5260~5320MHz is less than 0.8 W / kg and Peak SAR values are less than 1.6W/kg. Therefore, testing for other channels is not required.

"Per KDB 447498, when the SAR procedures require multiple channels to be tested and the 1-g SAR for the highest output channel is less than 0.4 W/kg and peak SAR is less than 0.8W/kg, where the transmission band corresponding to all channels is ≤ 200 MHz, testing for the other channels is not required."

According to test data from table of section 4.2, SAR value of highest output power channel of 5500~5700MHz is less than 0.4 W / kg and Peak SAR values are less than 0.8W/kg. Therefore, testing for other channels is not required.

ITEM	TEST MODE	MODULATION	ASSESSMENT POSTITION	TESTED CHANNEL	REMARK
1	802.11a	BPSK	A / Cheek	36, 60, 120	Aux. antenna
2	802.11a	BPSK	A / Tilt	36, 60, 120	Aux. antenna

5. TEST RESULTS

5.1 TEST PROCEDURES

Use the software to control the EUT channel and transmission power. Then record the conducted power before the testing. Place the EUT to the specific test location. After the testing, must writing down the conducted power of the EUT into the report. The SAR value was calculated via the 3D spline interpolation algorithm that has been implemented in the software of DASY5 SAR measurement system manufactured and calibrated by SPEAG. According to the IEEE 1528 standards, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- Power reference measurement
- Verification of the power reference measurement
- Area scan
- Zoom scan
- Power reference measurement

The area scan was performed for the highest spatial SAR location. The zoom scan with 30mm x 30mm x 30mm volume was performed for SAR value averaged over 1g and 10g spatial volumes.

In the zoom scan, the distance between the measurement point at the probe sensor location (geometric center behind the probe tip) and the phantom surface is 3mm and maintained at a constant distance of ± 0.5 mm during a zoom scan to determine peak SAR locations. The distance is 3mm between the first measurement point and the bottom surface of the phantom. The secondary measurement point to the bottom surface of the phantom is with 8mm separation distance. The cube size is 7 x 7 x 7 points consists of 343 points and the grid space is 5mm.

The measurement time is 0.5s at each point of the zoom scan. The probe boundary effect compensation shall be applied during the SAR test. Because of the tip of the probe to the Phantom surface separated distances are longer than half a tip probe diameter.

In the area scan, the separation distance is 3mm between the each measurement point and the phantom surface. The scan size shall be included the transmission portion of the EUT. The measurement time is the same as the zoom scan. At last the reference power drift shall be less than $\pm 5\%$.

5.3 SAR LIMITS

	SAR ((W/kg)		
HUMAN EXPOSURE	(GENERAL POPULATION / UNCONTROLLED EXPOSURE ENVIRONMENT)	(OCCUPATIONAL / CONTROLLED EXPOSURE ENVIRONMENT)		
Spatial Average (whole body)	0.08	0.4		
Spatial Peak (averaged over 1 g)	1.6	8.0		
Spatial Peak (hands / wrists / feet / ankles averaged over 10 g)	4.0	20.0		

- 1. This limits accord to 47 CFR 2.1093 Safety Limit.
- 2. The EUT property been complied with the partial body exposure limit under the general population environment.

5.4 RECIPES FOR TISSUE SIMULATING LIQUIDS

For the measurement of the field distribution inside the SAM phantom, the phantom must be filled with 25 litters of tissue simulation liquid.

The following ingredients are used:

• WATER- Deionized water (pure H20), resistivity _16 M - as basis for the liquid

• SUGAR- Refined sugar in crystals, as available in food shops - to reduce relative

permittivity

• **SALT-** Pure NaCl - to increase conductivity

• **CELLULOSE-** Hydroxyethyl-cellulose, medium viscosity (75-125mPa.s, 2% in water,

20_C),

CAS # 54290 - to increase viscosity and to keep sugar in solution

• PRESERVATIVE- Preventol D-7 Bayer AG, D-51368 Leverkusen, CAS # 55965-84-9 - to

prevent the spread of bacteria and molds

• **DGMBE-** Diethylenglycol-monobuthyl ether (DGMBE), Fluka Chemie GmbH,

CAS # 112-34-5 - to reduce relative permittivity

THE INFORMATION FOR 5GHz SIMULATING LIQUID

The 5GHz liquids was purchased from SPEAG.

Body liquid model: HSL 5800, P/N: SL AAH 5800 AA

Head liquid model: M 5800, P/N: SL AAM 580 AD

5GHz liquids contain the following ingredients:

Water 64 - 78%

Mineral Oil 11 - 18%

Emulsifiers 9 - 15%

Additives and Salt 2 - 3%

Testing the liquids using the Agilent Network Analyzer E8358A and Agilent Dielectric Probe Kit 85070D. The testing procedure is following as

- 1. Turn Network Analyzer on and allow at least 30min. warm up.
- 2. Mount dielectric probe kit so that interconnecting cable to Network Analyzer will not be moved during measurements or calibration.
- 3. Pour de-ionized water and measure water temperature (±1°).
- 4. Set water temperature in Agilent-Software (Calibration Setup).
- 5. Perform calibration.
- 6. Validate calibration with dielectric material of known properties (e.g. polished ceramic slab with >8mm thickness ϵ '=10.0, ϵ "=0.0). If measured parameters do not fit within tolerance, repeat calibration (±0.2 for ϵ ': ±0.1 for ϵ ").
- 7. Conductivity can be calculated from ε'' by $\sigma = \omega \varepsilon_0 \varepsilon'' = \varepsilon'' f [GHz] / 18.$
- 8. Measure liquid shortly after calibration. Repeat calibration every hour.
- 9. Stir the liquid to be measured. Take a sample (~ 50ml) with a syringe from the center of the liquid container.
- 10. Pour the liquid into a small glass flask. Hold the syringe at the bottom of the flask to avoid air bubbles.
- 11. Put the dielectric probe in the glass flask. Check that there are no air bubbles in front of the opening in the dielectric probe kit.
- 12. Perform measurements.
- 13. Adjust medium parameters in DASY5 for the frequencies necessary for the measurements ('Setup Config', select medium (e.g. Brain 900MHz) and press 'Option'-button.
- 14. Select the current medium for the frequency of the validation (e.g. Setup Medium Brain 900MHz).

5.5 TEST EQUIPMENT FOR TISSUE PROPERTY

ITEM	NAME	BRAND	TYPE	SERIES NO.	DATE OF CALIBRATION	DUE DATE OF CALIBRATION
1	Network Analyzer	Agilent	E8358A	US41480538	Nov. 27, 2008	Nov. 26, 2009
2	Dielectric Probe	Agilent	85070D	US01440176	NA	NA

- 1. Before starting, all test equipment shall be warmed up for 30min.
- 2. The tolerance (k=1) specified by Agilent for general dielectric measurements, deriving from inaccuracies in the calibration data, analyzer drift, and random errors, are usually ±2.5% and ±5% for measured permittivity and conductivity, respectively. However, the tolerances for the conductivity is smaller for material with large loss tangents, i.e., less than ±2.5% (k=1). It can be substantially smaller if more accurate methods are applied.

6. SYSTEM VALIDATION

The system validation was performed in the flat phantom with equipment listed in the following table. Since the SAR value is calculated from the measured electric field, dielectric constant and conductivity of the body tissue and the SAR is proportional to the square of the electric field. So, the SAR value will be also proportional to the RF power input to the system validation dipole under the same test environment. In our system validation test, 250mW RF input power was used.

6.1 TEST EQUIPMENT

8	Power Sensor	Agilent	E9327A	US40441181	Sep. 28, 2008	Sep. 29, 2009

NOTE: Before starting the measurement, all test equipment shall be warmed up for 30min.

6.2 TEST PROCEDURE

Before the system performance check, we need only to tell the system which components (probe, medium, and device) are used for the system performance check; the system will take care of all parameters. The dipole must be placed beneath the flat section of the SAM Twin Phantom with the correct distance holder in place. The distance holder should touch the phantom surface with a light pressure at the reference marking (little cross) and be oriented parallel to the long side of the phantom. Accurate positioning is not necessary, since the system will search for the peak SAR location, except that the dipole arms should be parallel to the surface. The device holder for mobile phones can be left in place but should be rotated away from the dipole.

- 1. The "Power Reference Measurement" and "Power Drift Measurement" jobs are located at the beginning and end of the batch process. They measure the field drift at one single point in the liquid over the complete procedure. The indicated drift is mainly the variation of the amplifier output power. If it is too high (above ±0.1 dB), the system performance check should be repeated; some amplifiers have very high drift during warm-up. A stable amplifier gives drift results in the DASY system below ±0.02dB.
- 2. The "Surface Check" job tests the optical surface detection system of the DASY system by repeatedly detecting the surface with the optical and mechanical surface detector and comparing the results. The output gives the detecting heights of both systems, the difference between the two systems and the standard deviation of the detection repeatability. Air bubbles or refraction in the liquid due to separation of the sugar-water mixture gives poor repeatability (above ±0.1mm). In that case it is better to abort the system performance check and stir the liquid.

- 3. The "Area Scan" job measures the SAR above the dipole on a plane parallel to the surface. It is used to locate the approximate location of the peak SAR. The proposed scan uses large grid spacing for faster measurement; due to the symmetric field, the peak detection is reliable. If a finer graphic is desired, the grid spacing can be reduced. Grid spacing and orientation have no influence on the SAR result.
- 4. The "Zoom Scan" job measures the field in a volume around the peak SAR value assessed in the previous "Area Scan" job (for more information see the application note on SAR evaluation).

About the validation dipole positioning uncertainty, the constant and low loss dielectric spacer is used to establish the correct distance between the top surface of the dipole and the bottom surface of the phantom, the error component introduced by the uncertainty of the distance between the liquid (i.e., phantom shell) and the validation dipole in the DASY5 system is less than ±0.1mm.

$$SAR_{tolerance}[\%] = 100 \times (\frac{(a+d)^2}{a^2} - 1)$$

As the closest distance is 10mm, the resulting tolerance SAR $_{tolerance}$ [%] is <2%.

6.3 VALIDATION RESULTS

NOTE: Please see Appendix for the photo of system validation test.

6.4 SYSTEM VALIDATION UNCERTAINTIES

In the table below, the system validation uncertainty with respect to the analytically assessed SAR value of a dipole source as given in the IEEE 1528 standard is given. This uncertainty is smaller than the expected uncertainty for mobile phone measurements due to the simplified setup and the symmetric field distribution.

Error Description	Tolerance (±%)	Probability Distribution	Divisor	(0	C _i)	Unce	dard rtainty %)	(V _i)

NOTE: About the system validation uncertainty assessment, please reference the section 7.

7. MEASUREMENT SAR PROCEDURE UNCERTAINTIES

The assessment of spatial peak SAR of the hand handheld devices is according to IEEE 1528 / EN 62209-1. All testing situation shall be met below these requirements.

- The system is used by an experienced engineer who follows the manual and the guidelines taught during the training provided by SPEAG.
- The probe has been calibrated within the requested period and the stated uncertainty for the relevant frequency bands does not exceed 4.8% (k=1).
- The validation dipole has been calibrated within the requested period and the system performance check has been successful.
- The DAE unit has been calibrated within the within the requested period.
- The minimum distance between the probe sensor and inner phantom shell is selected to be between 4 and 5mm.
- The operational mode of the DUT is CW, CDMA, FDMA or TDMA (GSM, DCS, PCS, IS136 and PDC) and the measurement/integration time per point is >500 ms.
- The dielectric parameters of the liquid have been assessed using Agilent 85070D dielectric probe kit or a more accurate method.
- The dielectric parameters are within 5% of the target values.
- The DUT has been positioned as described in section 3.

7.1. PROBE CALIBRATION UNCERTAINTY

SPEAG conducts the probe calibration in compliance with international and national standards (e.g. IEEE 1528, EN 62209-1, IEC 62209, etc.) under ISO17025. The uncertainties are stated on the calibration certificate. For the most relevant frequency bands, these values do not exceed 4.8% (k=1). If evaluations of other bands are performed for which the uncertainty exceeds these values, the uncertainty tables given in the summary have to be revised accordingly.

7.2. ISOTROPY UNCERTAINTY

The axial isotropy tolerance accounts for probe rotation around its axis while the hemispherical isotropy error includes all probe orientations and field polarizations. These parameters are assessed by SPEAG during initial calibration. In 2001, SPEAG further tightened its quality controls and warrants that the maximal deviation from axial isotropy is ± 0.20 dB, while the maximum deviation of hemispherical isotropy is ± 0.40 dB, corresponding to $\pm 4.7\%$ and $\pm 9.6\%$, respectively. A weighting factor of cp equal to 0.5 can be applied, since the axis of the probe deviates less than 30 degrees from the normal surface orientation.

7.3. BOUNDARY EFFECT UNCERTAINTY

The effect can be estimated according to the following error approximation formula

$$SAR_{tolerance}[\%] = SAR_{be}[\%] \times \frac{(d_{be} + d_{step})^2}{2d_{step}} \frac{e^{-\frac{d_{be}}{\delta/2}}}{\delta/2}$$

$$d_{be} + d_{step} < 10mm$$

The parameter d_{be} is the distance in mm between the surface and the closest measurement point used in the averaging process; d_{step} is the separation distance in mm between the first and second measurement points; δ is the minimum penetration depth in mm within the head tissue equivalent liquids (i.e., δ = 13.95mm at 3GHz); SAR_{be} is the deviation between the measured SAR value at the distance d_{be} from the boundary and the wave-guide analytical value SAR_{ref}.DASY5 applies a boundary effect compensation algorithm according to IEEE 1528, which is possible since the axis of the probe never deviates more than 30 degrees from the normal surface orientation. SAR_{be}[%] is assessed during the calibration process and SPEAG warrants that the uncertainty at distances larger than 4mm is always less than 1%.In summary, the worst case boundary effect SAR tolerance[%] for scanning distances larger than 4mm is < ± 0.8%.

7.4. PROBE LINEARITY UNCERTAINTY

Field probe linearity uncertainty includes errors from the assessment and compensation of the diode compression effects for CW and pulsed signals with known duty cycles. This error is assessed using the procedure described in IEEE 1528 / EN 62209-1. For SPEAG field probes, the measured difference between CW and pulsed signals, with pulse frequencies between 10Hz and 1kHz and duty cycles between 1 and 100, is $< \pm 0.20$ dB ($< \pm 4.7\%$).

7.5. READOUT ELECTRONICS UNCERTAINTY

All uncertainties related to the probe readout electronics (DAE unit), including the gain and linearity of the instrumentation amplifier, its loading effect on the probe, and accuracy of the signal conversion algorithm, have been assessed accordingly to IEEE 1528 / EN 62209-1. The combination (root-sum-square RSS method) of these components results in an overall maximum error of $\pm 1.0\%$.

7.6. RESPONSE TIME UNCERTAINTY

The time response of the field probes is assessed by exposing the probe to a well-controlled electric field producing SAR larger than 2.0W/kg at the tissue medium surface. The signal response time is evaluated as the time required by the system to reach 90% of the expected final value after an on/of switch of the power source. Analytically, it can be expressed as:

$$SAR_{tolerance} [\%] = 100 \times (\frac{T_m}{T_m + \tau e^{-T_m/\tau} - \tau} - 1)$$

where Tm is 500 ms, i.e., the time between measurement samples, and $_{\rm T}$ the time constant. The response time $_{\rm T}$ of SPEAG's probes is <5ms. In the current implementation, DASY5 waits longer than 100 ms after having reached the grid point before starting a measurement, i.e., the response time uncertainty is negligible.

7.7. INTEGRATION TIME UNCERTAINTY

If the device under test does not emit a CW signal, the integration time applied to measure the electric field at a specific point may introduce additional uncertainties due to the discretization and can be assessed as follows

$$SAR_{tolerance} \cite{Model} = 100 \times \sum_{all sub-frames} \frac{t_{frame}}{t_{integration}} \frac{slot_{idle}}{slot_{total}}$$

The tolerances for the different systems are given in Table 7.1, whereby the worst-case $SAR_{tolerance}$ is 2.6%.

System	SAR _{tolerance} %
CW	0
CDMA*	0
WCDMA*	0
FDMA	0
IS-136	2.6
PDC	2.6
GSM/DCS/PCS	1.7
DECT	1.9
Worst-Case	2.6

TABLE 7.1

7.8. PROBE POSITIONER MECHANICAL TOLERANCE

The mechanical tolerance of the field probe positioner can introduce probe positioning uncertainties. The resulting SAR uncertainty is assessed by comparing the SAR obtained according to the specifications of the probe positioner with respect to the actual position defined by the geometric enter of the probe sensors. The tolerance is determined as:

$$SAR_{tolerance}$$
[%] = $100 \times \frac{d_{ph}}{\delta/2}$

The specified repeatability of the RX robot family used in DASY5 systems is $\pm 25\mu m$. The absolute accuracy for short distance movements is better than $\pm 0.1 mm$, i.e., the SAR_{tolerance}[%] is better than 1.5% (rectangular).

7.9. PROBE POSITIONING

The probe positioning procedures affect the tolerance of the separation distance between the probe tip and the phantom surface as:

$$SAR_{tolerance} [\%] = 100 \times \frac{d_{ph}}{\delta/2}$$

where d_{ph} is the maximum deviation of the distance between the probe tip and the phantom surface. The optical surface detection has a precision of better than 0.2mm, resulting in an SAR_{tolerance}[%] of <2.9% (rectangular distribution). Since the mechanical detection provides better accuracy, 2.9% is a worst-case figure for DASY5 system.

7.10. PHANTOM UNCERTAINTY

The SAR measurement uncertainty due to SPEAG phantom shell production tolerances has been evaluated using

$$SAR_{tolerance}$$
[%] $\cong 100 \times \frac{2d}{a}$, $d << a$

For a maximum deviation d of the inner and outer shell of the phantom from that specified in the CAD file of ± 0.2 mm, and a 10mm spacing a between source and tissue liquid, the calculated phantom uncertainty is $\pm 4.0\%$.

7.11. DASY5 UNCERTAINTY BUDGET

Error Description	Tolerance (±%)	Probability Distribution	Divisor	(0	Ç _i)	Uncer	dard tainty %)	(v _i)

8. INFORMATION ON THE TESTING LABORATORIES

We, Bureau Veritas Consumer Products Services (H.K.) Ltd., Taoyuan Branch, were founded in 1988 to provide our best service in EMC, Radio, Telecom and Safety consultation. Our laboratories are accredited and approved by the following approval agencies according to ISO/IEC 17025.

USA FCC, NVLAP
GERMANY TUV Rheinland

JAPAN VCCI NORWAY NEMKO

CANADA INDUSTRY CANADA, CSA

R.O.C. TAF, BSMI, NCC

NETHERLANDS Telefication

SINGAPORE GOST-ASIA (MOU)
RUSSIA CERTIS (MOU)

Copies of accreditation certificates of our laboratories obtained from approval agencies can be downloaded from our web site: www.adt.com.tw/index.5/phtml. If you have any comments, please feel free to contact us at the following:

APPENDIX A: TEST DATA

Liquid Level Photo

Tissue MSL5800MHz D=155mm

Date/Time: 2009/3/24 02:21:41

Test Laboratory: Bureau Veritas ADT

M01-Right Head-Cheek-11a Ch36 / Aux ANT

DUT: MOBILE COMPUTER; Type: MC 9596

Communication System: 802.11a; Frequency: 5180 MHz; Duty Cycle: 1:1

Medium: HSL5800 Medium parameters used: f = 5180 MHz; $\sigma = 4.72$ mho/m; $\varepsilon_r = 35.9$; $\rho = 1000$ kg/m³

Phantom section: Right Section; DUT test position: Cheek; Modulation type: BPSK

DASY4 Configuration:

- Probe: EX3DV4 SN3578; ConvF(4.65, 4.65, 4.65); Calibrated: 2008/5/20
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn861; Calibrated: 2008/9/22
- Phantom: SAM with CRP; Type: SAM; Serial: TP-1485
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Touch Position - Low Channel 36/Area Scan (16x27x1): Measurement grid: dx=10mm,

dy=10mm

Maximum value of SAR (measured) = 0.030 mW/g

Touch Position - Low Channel 36/Zoom Scan (8x8x8)/Cube 0: Measurement grid: dx=4.3mm,

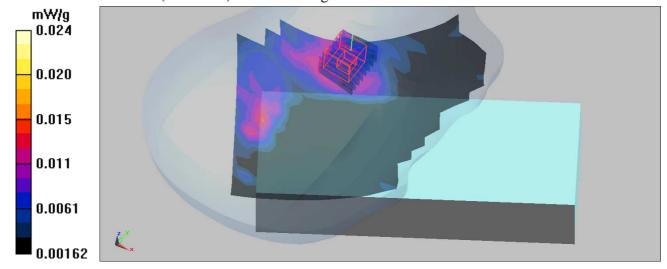

dy=4.3mm, dz=3mm

Reference Value = 1.43 V/m

Peak SAR (extrapolated) = 0.041 W/kg

SAR(1 g) = 0.013 mW/g; SAR(10 g) = 0.011 mW/g

Maximum value of SAR (measured) = 0.024 mW/g

Date/Time: 2009/3/24 03:13:05

Test Laboratory: Bureau Veritas ADT

M01-Right Head-Cheek-11a Ch60 / Aux ANT

DUT: MOBILE COMPUTER; Type: MC 9596

Communication System: 802.11a; Frequency: 5300 MHz; Duty Cycle: 1:1

Medium: HSL5800 Medium parameters used: f = 5300 MHz; $\sigma = 4.87$ mho/m; $\varepsilon_r = 35.7$; $\rho = 1000$ kg/m³

Phantom section: Right Section; DUT test position: Cheek; Modulation type: BPSK

DASY4 Configuration:

- Probe: EX3DV4 SN3578; ConvF(4.65, 4.65, 4.65); Calibrated: 2008/5/20
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn861; Calibrated: 2008/9/22
- Phantom: SAM with CRP; Type: SAM; Serial: TP-1485
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Touch Position - Mid Channel 60/Area Scan (16x27x1): Measurement grid: dx=10mm,

dy=10mm

Maximum value of SAR (measured) = 0.050 mW/g

Touch Position - Mid Channel 60/Zoom Scan (8x8x8)/Cube 0: Measurement grid: dx=4.3mm,

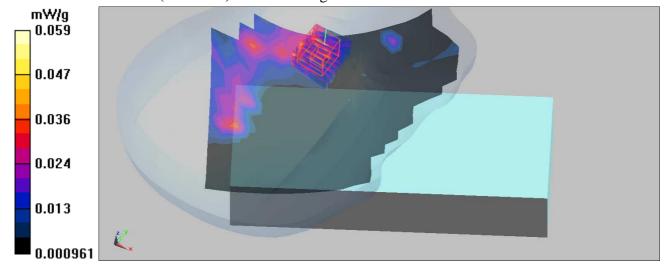

dy=4.3mm, dz=3mm

Reference Value = 0.932 V/m

Peak SAR (extrapolated) = 0.141 W/kg

SAR(1 g) = 0.045 mW/g; SAR(10 g) = 0.023 mW/g

Maximum value of SAR (measured) = 0.059 mW/g

Date/Time: 2009/3/24 04:02:07

Test Laboratory: Bureau Veritas ADT

M01-Right Head-Cheek-11a Ch120 / Aux ANT

DUT: MOBILE COMPUTER; Type: MC 9596

Communication System: 802.11a; Frequency: 5600 MHz; Duty Cycle: 1:1

Medium: HSL5800 Medium parameters used: f = 5600 MHz; $\sigma = 5.15$ mho/m; $\varepsilon_r = 35.3$; $\rho = 1000$ kg/m³

Phantom section: Right Section; DUT test position: Cheek; Modulation type: BPSK

DASY4 Configuration:

- Probe: EX3DV4 SN3578; ConvF(4.3, 4.3, 4.3); Calibrated: 2008/5/20
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn861; Calibrated: 2008/9/22
- Phantom: SAM with CRP; Type: SAM; Serial: TP-1485
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Touch Position - Mid Channel 120/Area Scan (16x27x1): Measurement grid: dx=10mm,

dy=10mm

Maximum value of SAR (measured) = 0.071 mW/g

Touch Position - Mid Channel 120/Zoom Scan (8x8x8)/Cube 0: Measurement grid:

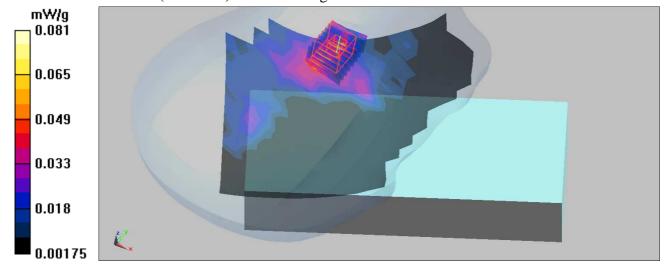

dx=4.3mm, dy=4.3mm, dz=3mm

Reference Value = 0.827 V/m

Peak SAR (extrapolated) = 0.171 W/kg

SAR(1 g) = 0.059 mW/g; SAR(10 g) = 0.029 mW/g

Maximum value of SAR (measured) = 0.081 mW/g

Date/Time: 2009/3/24 05:49:28

Test Laboratory: Bureau Veritas ADT

M02-Right Head-Tilt-11a Ch36 / Aux ANT

DUT: MOBILE COMPUTER; Type: MC 9596

Communication System: 802.11a; Frequency: 5180 MHz; Duty Cycle: 1:1

Medium: HSL5800 Medium parameters used: f = 5180 MHz; $\sigma = 4.72$ mho/m; $\varepsilon_r = 35.9$; $\rho = 1000$ kg/m³

Phantom section: Right Section; DUT test position: Tilt; Modulation type: BPSK

DASY4 Configuration:

- Probe: EX3DV4 SN3578; ConvF(4.65, 4.65, 4.65); Calibrated: 2008/5/20
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn861; Calibrated: 2008/9/22
- Phantom: SAM with CRP; Type: SAM; Serial: TP-1485
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Tilt Position - Low Channel 36/Area Scan (15x27x1): Measurement grid: dx=10mm, dy=10mm Maximum value of SAR (measured) = 0.031 mW/g

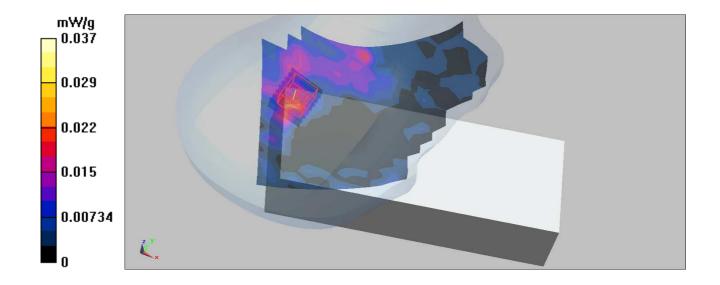

Tilt Position - Low Channel 36/Zoom Scan (8x8x8)/Cube 0: Measurement grid: dx=4.3mm, dy=4.3mm, dz=3mm

Reference Value = 0.919 V/m

Peak SAR (extrapolated) = 0.174 W/kg

SAR(1 g) = 0.024 mW/g; SAR(10 g) = 0.00883 mW/g

Maximum value of SAR (measured) = 0.037 mW/g

Zeughausstrasse 43, 8004 Zurich, Switzerland Phone ±41 1 245 9700 Fav ±41 1 245 9779 info@speag.com, http://www.speag.com

Certificate of Conformity / First Article Inspection

Item	SAM Twin Phantom V4.0	
Type No	QD 000 P40 C	
Series No	TP-1150 and higher	
Manufacturer	SPEAG	
	Zeughausstrasse 43	
	CH-8004 Zürich	
	Switzerland	

Tests

The series production process used allows the limitation to test of first articles.

Complete tests were made on the pre-series Type No. QD 000 P40 AA, Serial No. TP-1001 and on the series first article Type No. QD 000 P40 BA, Serial No. TP-1006. Certain parameters have been retested using further series items (called samples) or are tested at each item.

Test	Requirement	Details	Units tested
Dimensions	Compliant with the geometry	IT'IS CAD File (*)	First article,
	according to the CAD model.		Samples
Material thickness	Compliant with the requirements	2mm +/- 0.2mm in flat	First article,
of shell	according to the standards	and specific areas of	Samples,
		head section	TP-1314 ff.
Material thickness	Compliant with the requirements	6mm +/- 0.2mm at ERP	First article,
at ERP	according to the standards		All items
Material	Dielectric parameters for required	300 MHz – 6 GHz:	Material
parameters	frequencies	Relative permittivity < 5,	samples
		Loss tangent < 0.05	
Material resistivity	The material has been tested to be	DEGMBE based	Pre-series,
	compatible with the liquids defined in	simulating liquids	First article,
	the standards if handled and cleaned		Material
	according to the instructions.		samples
	Observe technical Note for material		
	compatibility.		
Sagging	Compliant with the requirements	< 1% typical < 0.8% if	Prototypes,
	according to the standards.	filled with 155mm of	Sample
	Sagging of the flat section when filled	HSL900 and without	testing
	with tissue simulating liquid.	DUT below	

Standards

- [1] CENELEC EN 50361
- [2] IEEE Std 1528-2003
- [3] IEC 62209 Part I
- [4] FCC OET Bulletin 65, Supplement C, Edition 01-01
- (*) The IT'IS CAD file is derived from [2] and is also within the tolerance requirements of the shapes of the other documents.

Conformity

Based on the sample tests above, we certify that this item is in compliance with the uncertainty requirements of SAR measurements specified in standards [1] to [4].

Date

07.07.2005
